SAP JOULE ENABLEMENT

Joule Readiness & Activation

Know whether your SAP landscape is ready for Joule - what works today, what blocks you, and what it takes to go live.

HOW WE ENGAGE

Readiness Assessment

We assess your SAP products, BTP setup and identity architecture, and hand you a scored, evidence-backed verdict.

FIXED SCOPE

Activation Pilot

We clear the blockers and get Joule working for a defined pilot group in your non-production landscape.

QUOTED AFTER FINDINGS

Production Enablement

We roll out the approved scope to production and hand it over to the team who will run it.

QUOTED AFTER PILOT

WHAT YOU RECEIVE

- Readiness scorecard with the evidence behind each verdict
- Identity and integration architecture diagram
- Blocker list with owners and dependencies
- Remediation backlog, prioritized and estimated
- Activation roadmap through pilot to production

ASSESSMENT SCOPE

+ One SAP BTP global account
+ Up to two SAP product integrations
+ One agreed identity setup
+ Findings workshop + two follow-ups

WHY IDENTITY DECIDES THE TIMELINE

> Joule requires the integrated SAP products to share one SAP Cloud Identity Services tenant with consistent Global User IDs. For most landscapes that single constraint sets the timeline - which is why we check it first.

A clear path to enabling Joule - and an honest answer if you are not ready yet.

Assessment quoted as a fixed fee once scope is agreed. Pilot and production quoted after the findings.
